

Using XML in the IAEA-NDS: status, feedback and proposals

Viktor Zerkin

International Atomic Energy Agency, Nuclear Data Section

WPEC Subgroup-38 Meeting-6
OECD Nuclear Energy Agency, Issy-les-Moulineux, France
Paris, 20-22 May 2015

Topics:

1. Data formats in EXFOR-ENDF database and Web retrieval systems

- Data flow in EXFOR-ENDF Web system: overview
- Web translation EXFOR to XML: tasks
- Web translation ENDF-6 to GND, errors and feedback

2. Requirements for low level containers: EXFOR vs. ENDF

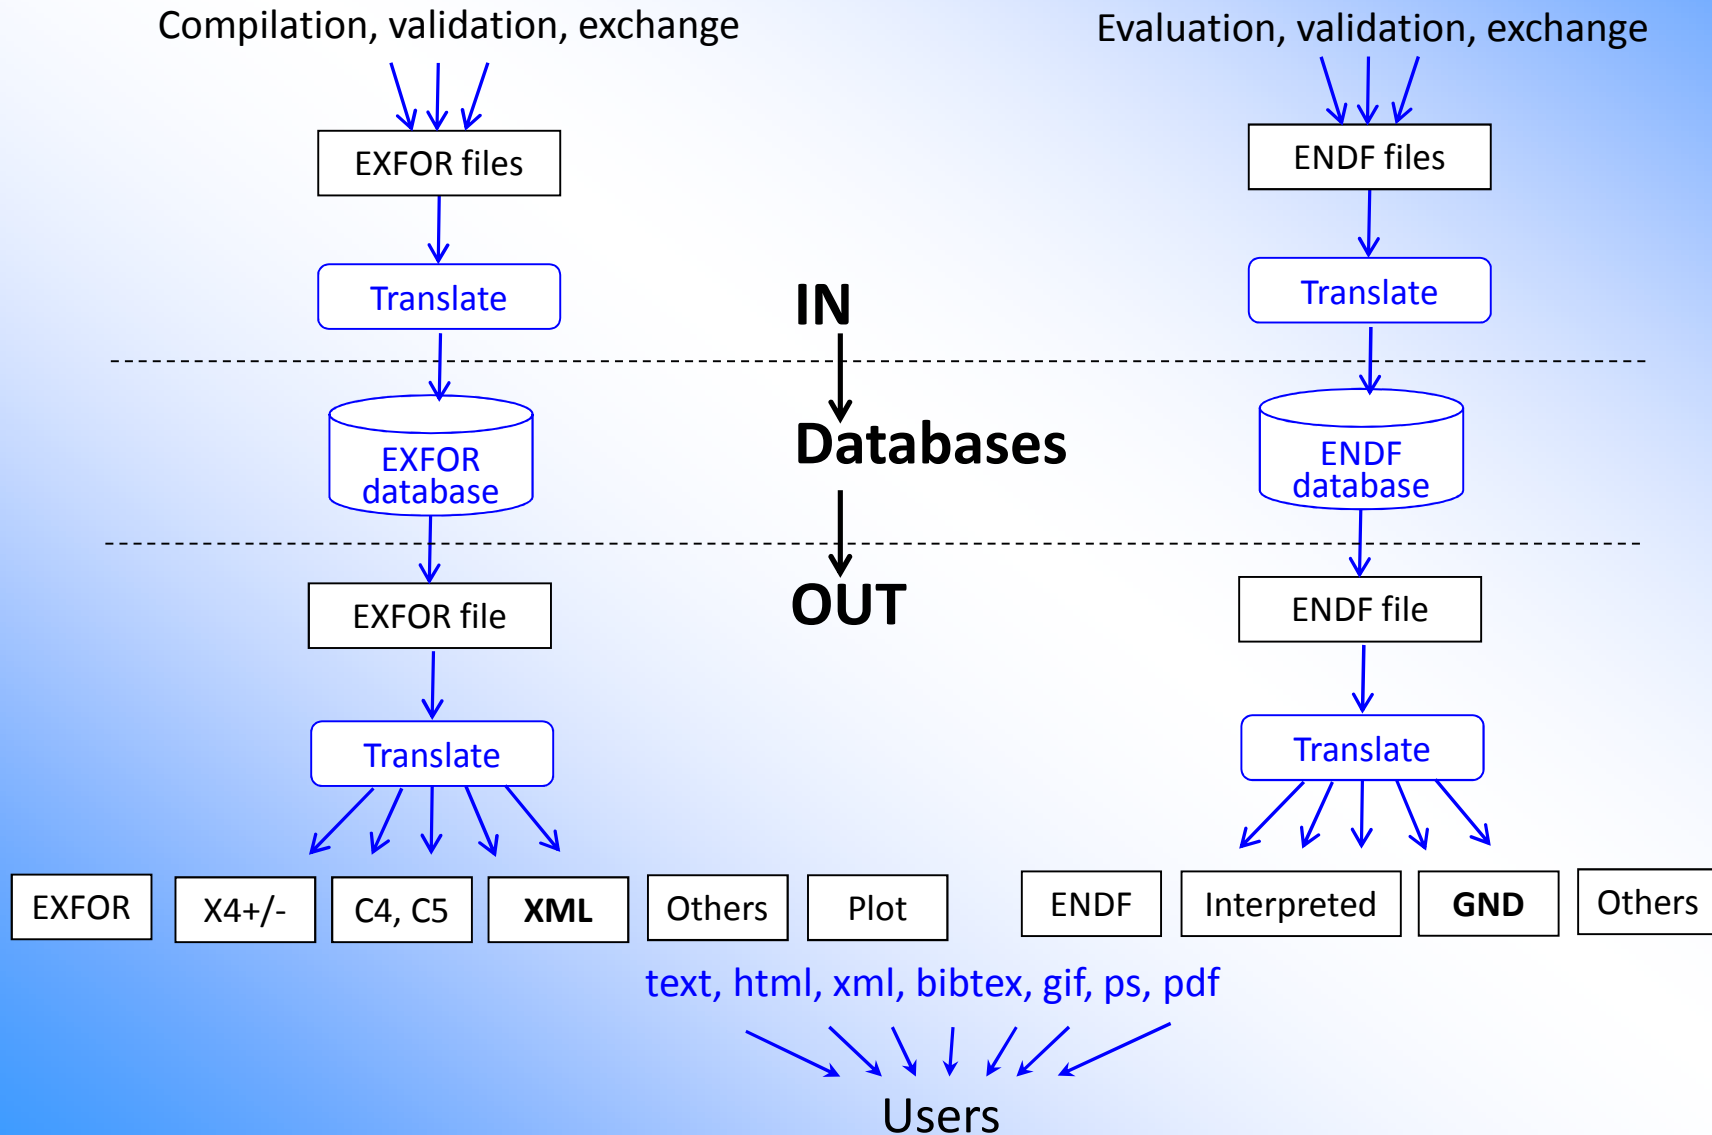

3. Proposals:

- “Normalized” XML presentation
- Low level I/O Fortran library for accessing XML files
- Extensions for low level containers

4. Summary (highlights)

1. Data formats in EXFOR-ENDF systems

Data flow in EXFOR-ENDF Web system

Usage of EXFOR, ENDF-6 and XML

1. EXFOR and ENDF-6 formatted data are used as:
 1. exchange
 2. input for database population software
 3. input for data dissemination programs
2. XML in EXFOR system:
 1. output logical equivalent to original EXFOR/Dictionaries
 2. output computational formats
 3. output/input of recipe for EN-EN correlation matrices
 4. intermediate format for input to the databases (sql.xml)
3. XML in ENDF systems:
 1. output format (GND)
 2. intermediate format for input to the databases (sql.xml)

XML is mostly used only as one of output formats

Web-translation EXFOR to XML

2009-2013

Tasks

1. To translate original EXFOR files to XML from EXFOR database from Web-retrieval system
2. To translate “standardized” EXFOR output to XML
3. To translate user’s EXFOR file to XML under MyEXFOR Web tool for compilers
4. To find out general problems if any
5. To study XML tools (XSL, XSD, Html-translation and validation)
6. To encourage users to use EXFOR-XML
7. To prepare background for developing EXFOR-XML as exchange format

Web-translation ENDF to XML 2012-2013

Tasks

1. To translate ENDF to GND under MyENDF Web tool for evaluators (using Fudge, LLNL)
2. To translate ENDF from ENDF database to GND under ENDF Web-retrieval system (IAEA database contains 46 ENDF libraries available for all Web users)
3. To find out general problems if any
4. To find mistakes and unfinished features in translation program
5. Provide users' feedback to translation program developers (LLNL)

Translate ENDF to GND under Web retrieval system

Problems?

1. Now translation ENDF to GND works only for ONE material in input file. (*Legal ENDF-6 data file can contain several materials from several sub-libraries and even libraries*)
2. Translation program produces TWO output XML files: data file and covariance file. Schema and translation program should have an option to generate single GND file from one ENDF-6 file.
(*This problem might be inherited from the decision to store data in schema MAT-**MT-MF** as it is done in ENDL, but not MAT-**MF-MT** as it is done in ENDF*)
3. Translation program fails on PEN file (i.e. ENDF-6 file from PREPRO chain including FIXUP)
4. Particle data properties for old evaluations: do they really to data used at that time?

2. Requirements for low level containers: EXFOR vs. ENDF

1. Large variety of Units (+translation to basic units)
2. Measured quantity is presented in vector
3. Empty values in data (<null>, “NaN”)
4. Complex descriptions of reaction/quantity
5. No curves (no need for interpolation)

3. Proposals

“Normalized” (canonical) XML file:

- 1) One tag in one line
- 2) Every tag in one line (i.e. <tag> and </tag>)
- 3) Every element-body text starts in new line separated from <tags>
- 4) 6 (or 10) numeric values in one data line (alternative:
max-string-length=1024)

Fortran XML-I/O library:

- 1) Simplified API (~SAX) for “normalized” XML, e.g.:
`openGndFile(fileName,iun),closeGndFile(iun)`
`readNextTag(iun,tag), writeNextTag(iun,tag)`
`readElementBodyR8(array)`
`readElementBodyText(array)`
- 2) Attract ENDF programming users:
create and offer simple examples

Proposals (cont.)

Extensions for low level containers:

- 1) Add possibility to `<XYs>` to store separately `{Xs}` and `{Ys}`
- 2) Allow additional arrays of dependent variables `{Ysj}` to `<XYs>`
- 3) Add possibility to generate `<values>` using `<series>`
- 4) Add attribute `default_value` to `<values>`

Decorative:

- 1) Rename manual describing low level containers from:
“General-Purpose Data Containers for Science and Engineering”
to: “General-Purpose Nuclear Data Containers”
- 2) Check acronyms with other networks and potential users, e.g.:
shape vs. dimension; function $x_0(x_n, \dots, x_1)$ vs. $y(x_1, \dots, x_n)$;
terminology in particle properties database with ENSDF
evaluators; compatible coding of reactions in EXFOR, etc.
- 3) Documentation: describe allowed nesting of elements

4. Summary (highlights)

- 1) “Normalized” XML
- 2) Fortran I/O library for XML
- 3) Low level compatibility with EXFOR.XML
- 4) Translation ENDF to GND for any valid ENDF file:
i.e. PEN files, files with several Materials from
different sub-libraries and libraries, and for old
libraries

Thank you
