Background

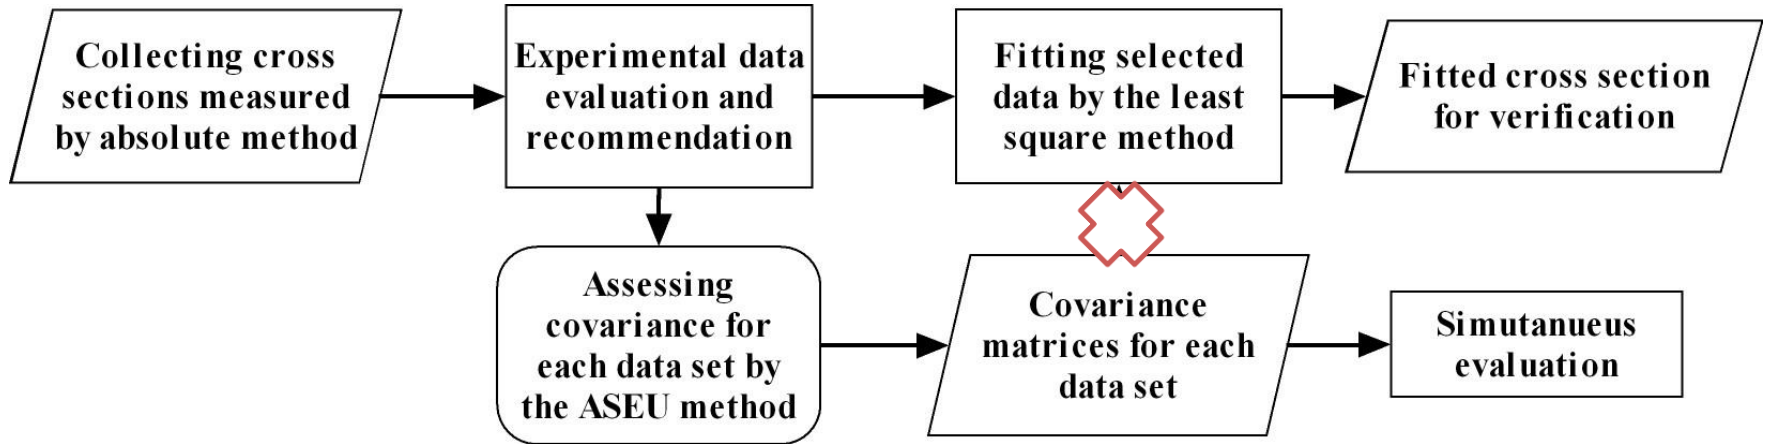

- **CENDL-2 and CENDL-3.1**

- U-238 (n,f) cross sections were evaluated based on the absolute measured experimental data of U-238(n,f) and the cross section ratio of U-238(n,f)/U-235(n,f) reaction.
 - **Absolute data were convert to ratio data and fitted together with the experimental ratio data.**
- From 0.10 to 20 MeV, U-235(n,f) cross section was standard evaluation by the CSEWG Standards Committee

- **Next CENDL**

- Simultaneous evaluation of cross sections of $^{235}\text{U}(n,f)$, $^{235}\text{U}(n,\gamma)$, $^{238}\text{U}(n,f)$, $^{238}\text{U}(n,\gamma)$ and et al. reactions are expected to be used.
- Evaluating cross sections measured by the absolute methods and assessing covariance for each data set is an important step before simultaneous evaluation.

Evaluation procedure

Analysis of Source of Experimental Uncertainty (ASEU)

Measured Quantity:

$$y = f(x_1, x_2, \dots, x_N)$$

$$\begin{aligned}
 Cov(y_i, y_j) &= \left\langle \left(\sum_{k=1}^N \frac{\partial f}{\partial x_k} \Big|_i \Delta x_{ki} \right) \left(\sum_{k'=1}^N \frac{\partial f}{\partial x_j} \Big|_i \Delta x_{k'j} \right) \right\rangle \\
 &= \sum_{kk'}^N \rho_{ij}^{kk'} \left(\frac{\partial f}{\partial x_k} \Big|_i \Delta x_{ki} \right) \left(\frac{\partial f}{\partial x_j} \Big|_i \Delta x_{k'j} \right) \\
 &= \sum_{kk'}^N \rho_{ij}^{kk'} \Delta y_{ki} \Delta y_{k'j}
 \end{aligned}$$

Selection of experimental data for $^{238}\text{U}(n, f)$ reaction

- **Absolute Measurements of $^{238}\text{U}(n, f)$ cross section in EXFOR**
 - 47 entries: from 1948 to 2014; E_n from $7e-4$ to 380MeV
 - Only data between 0.5 and 20MeV were consider.

experimental data of $^{238}\text{U}(n, f)$ cross section below 20MeV

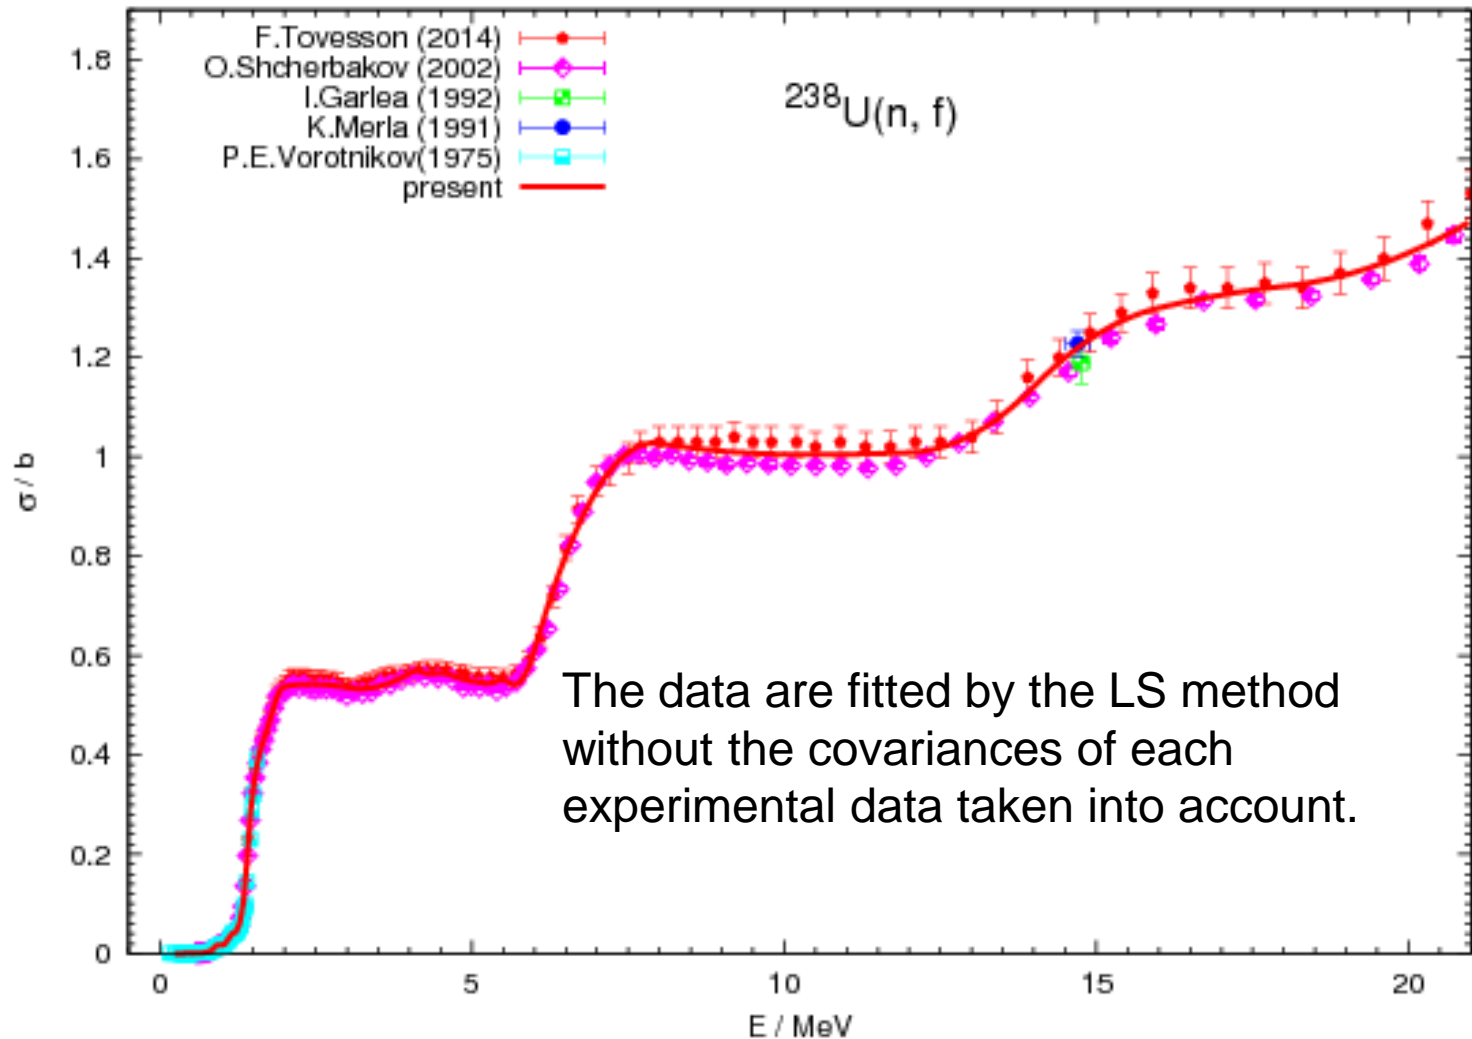

- **Only a few data sets with good quality should be used for the following evaluation**

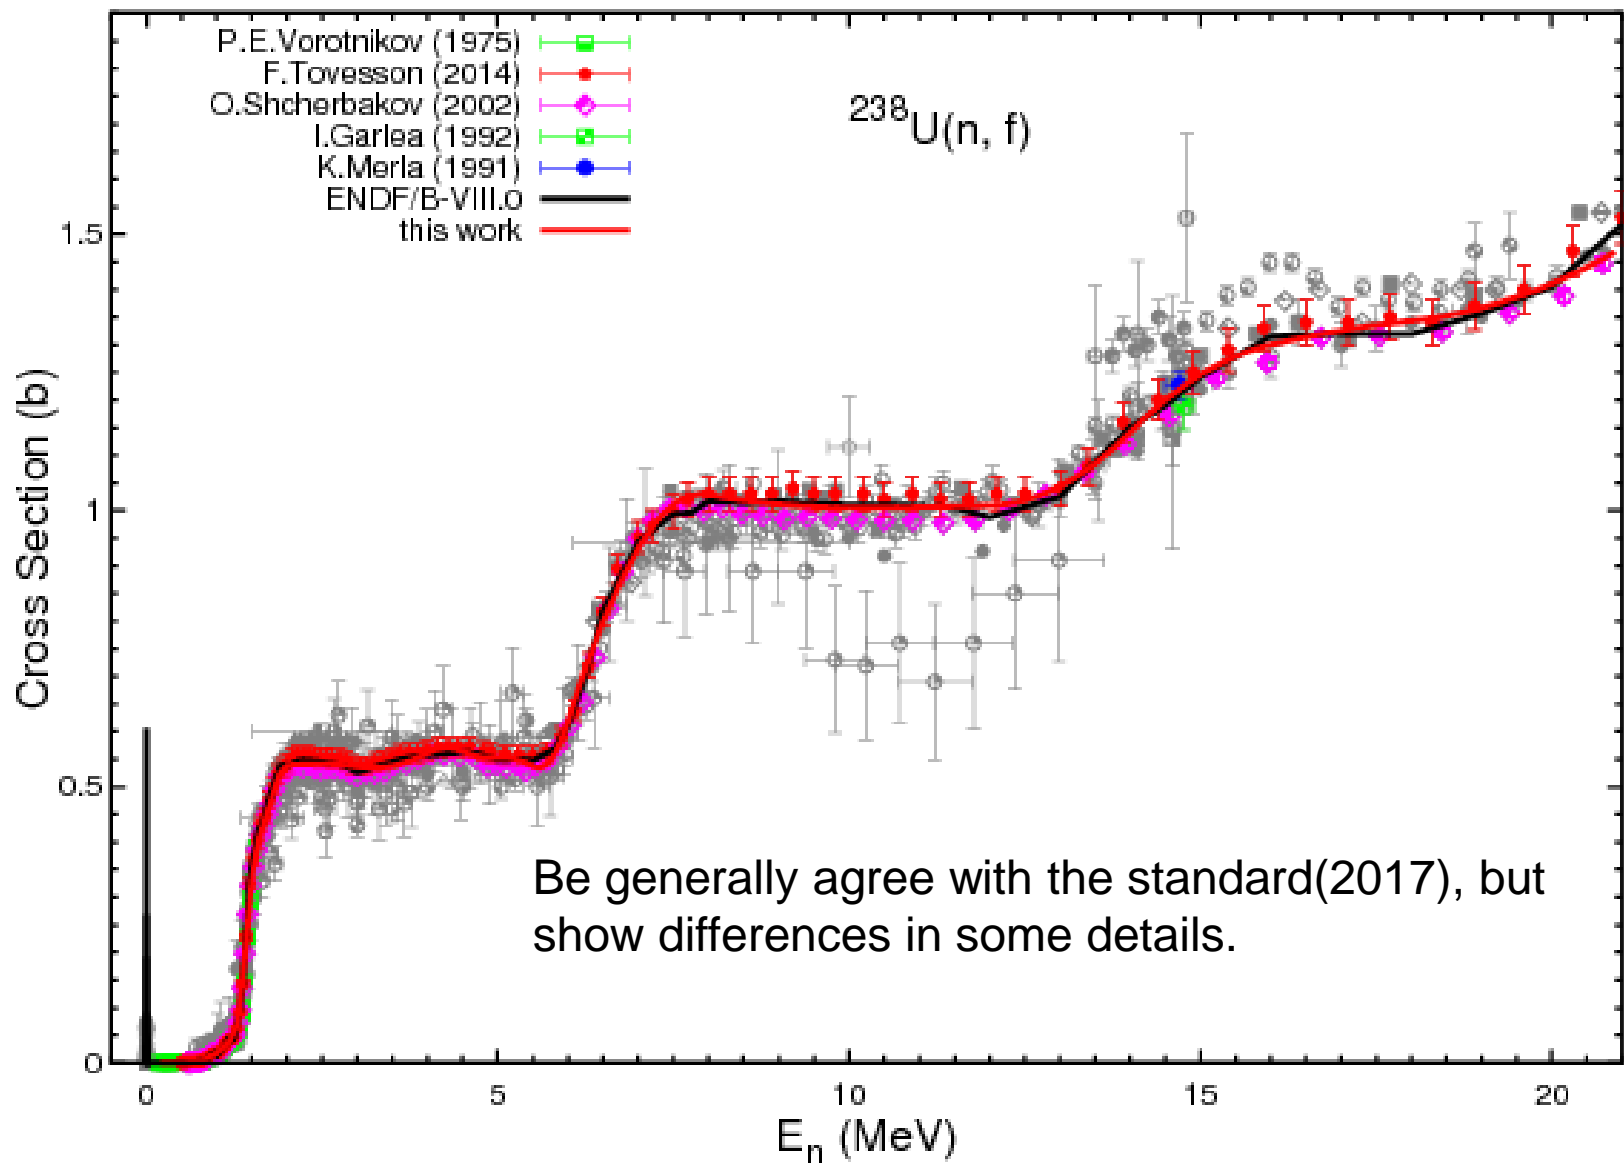

- 5 data sets which measured with better experimental conditions, such as neutron source, sample, detector, uncertainty and et al., were selected as representative.

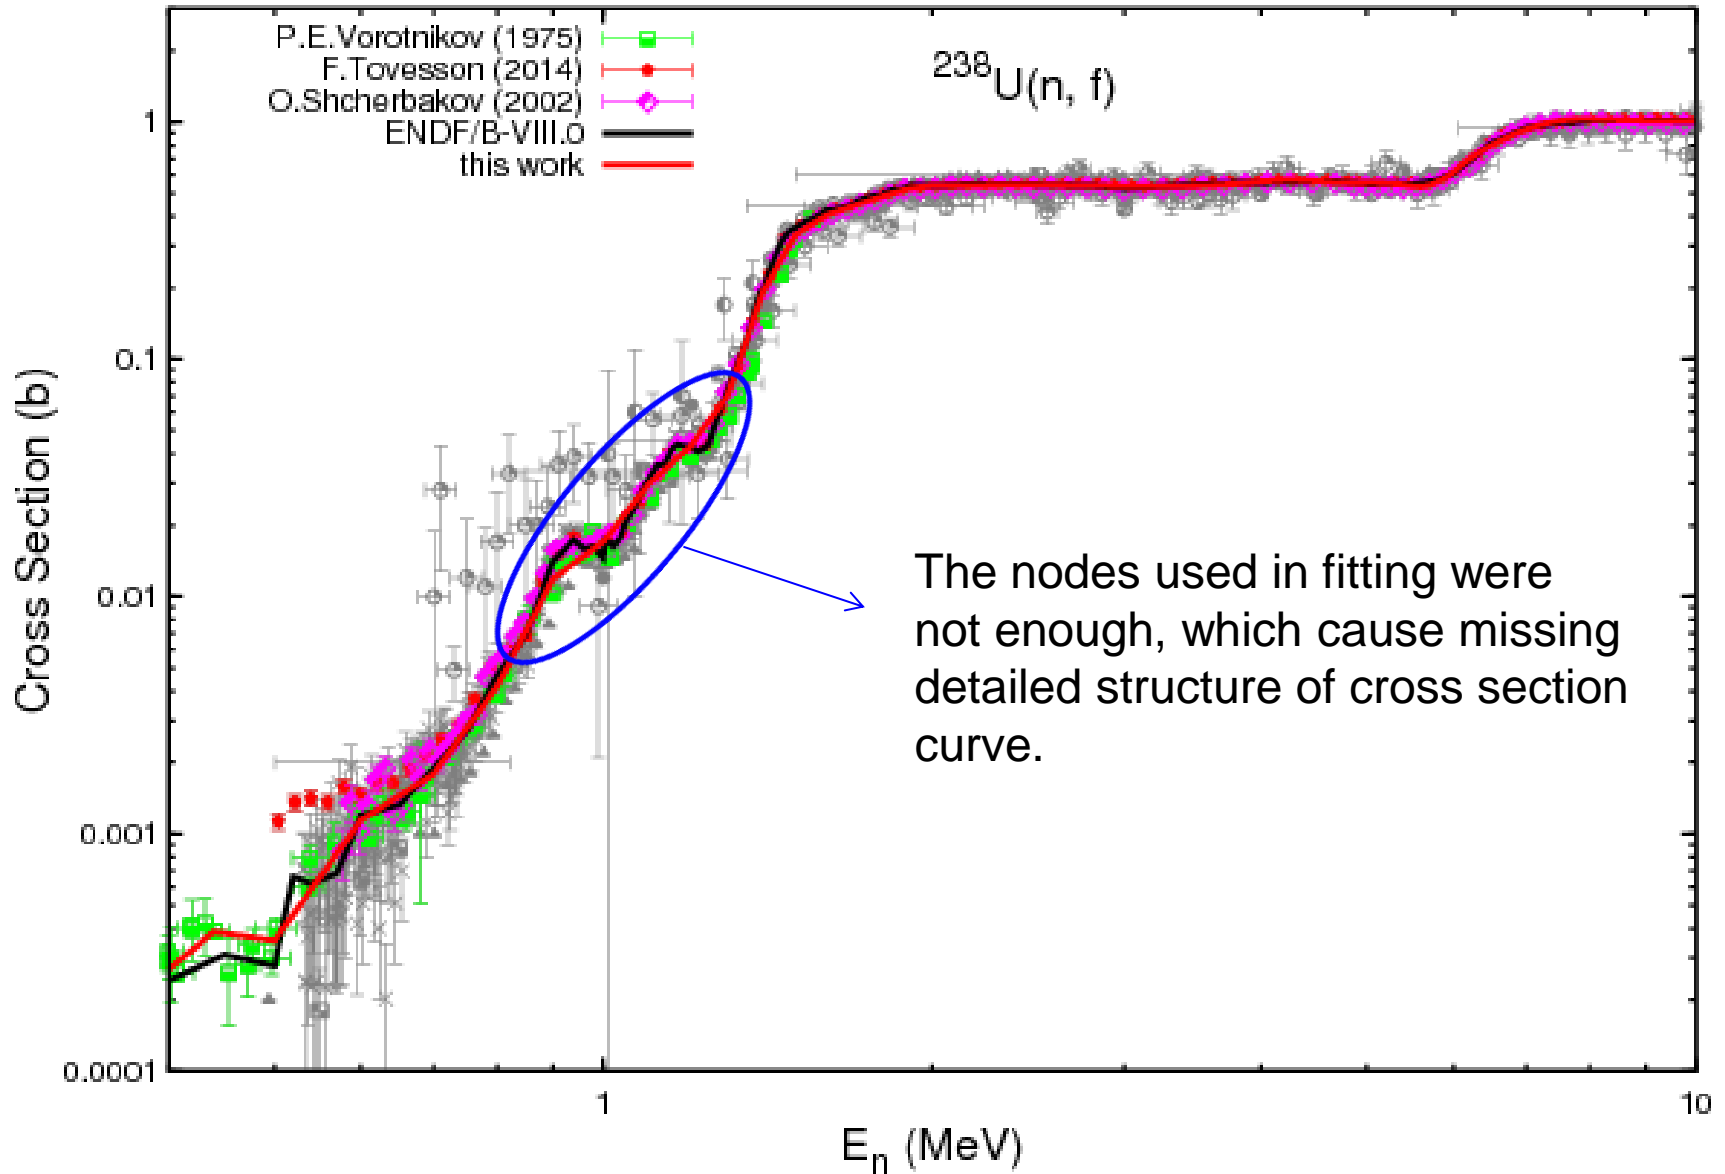

- $E_n < 1\text{MeV}$, 1 data set;
- $1 < E_n < 20\text{MeV}$, 4 data sets;
- 2 data sets around 14MeV.

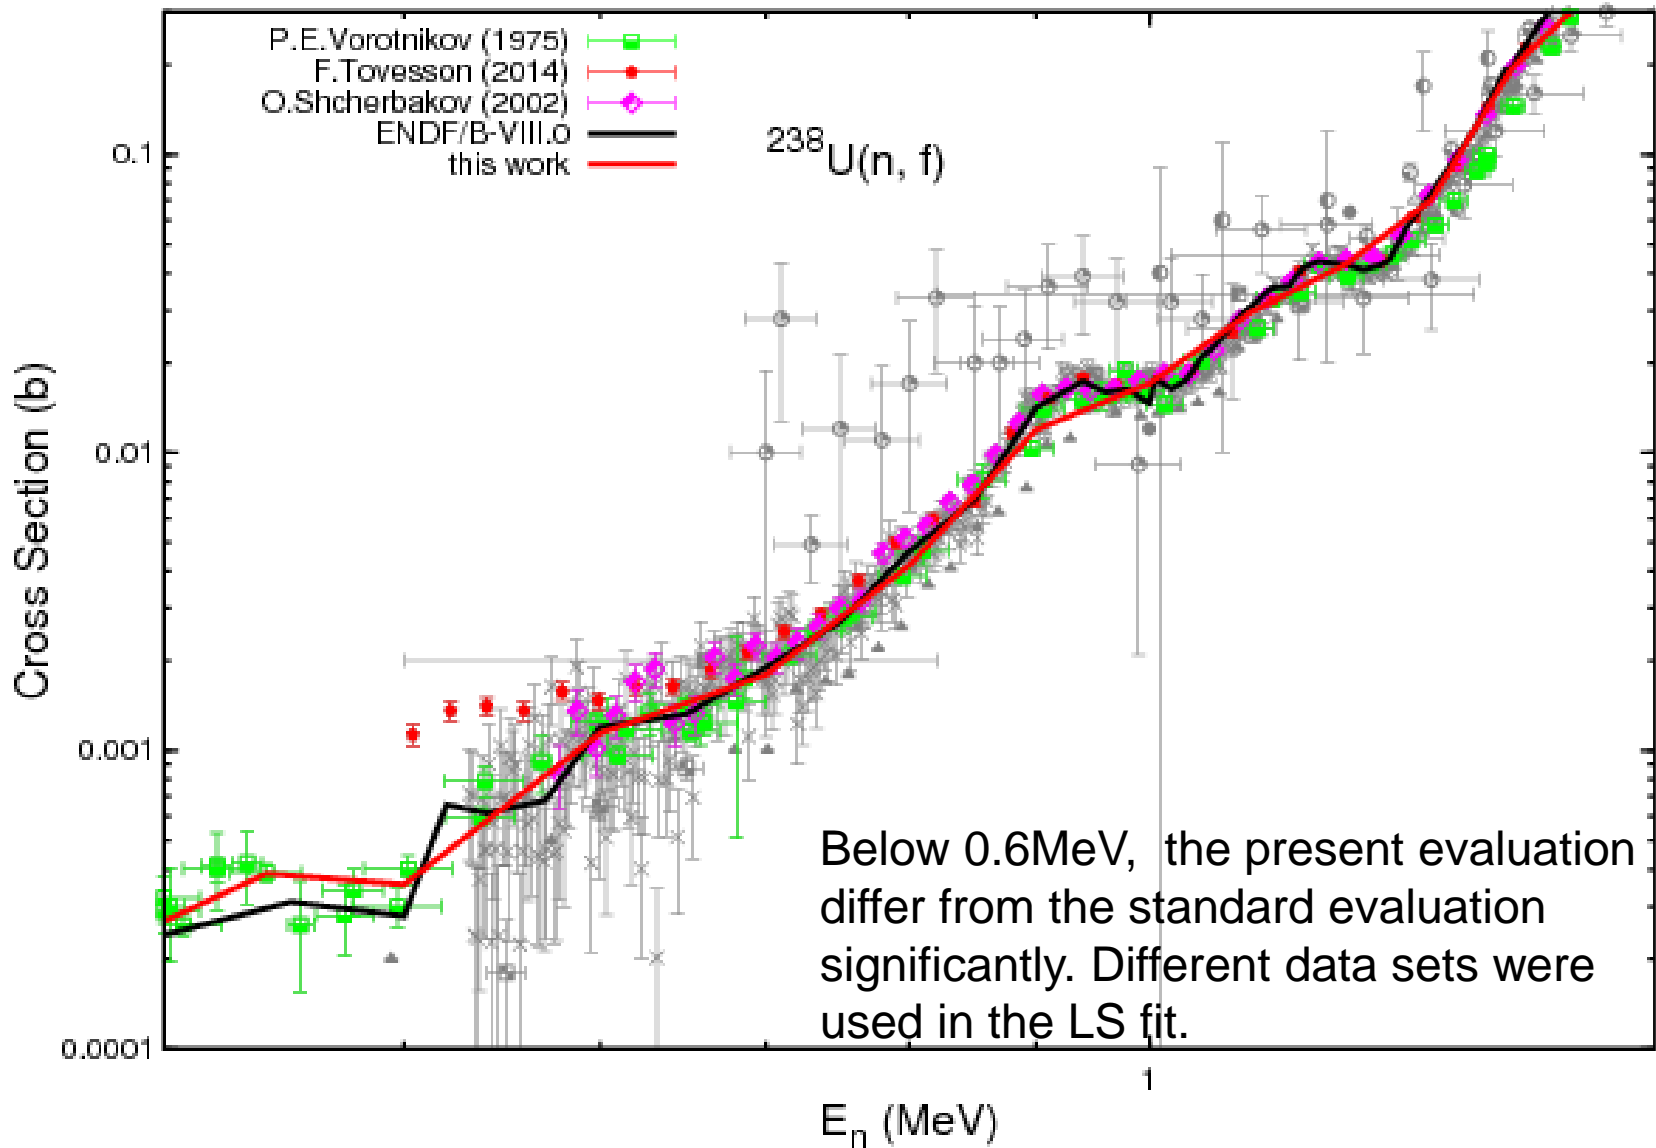

Comparison of evaluated U-238 (n, f) cross sections

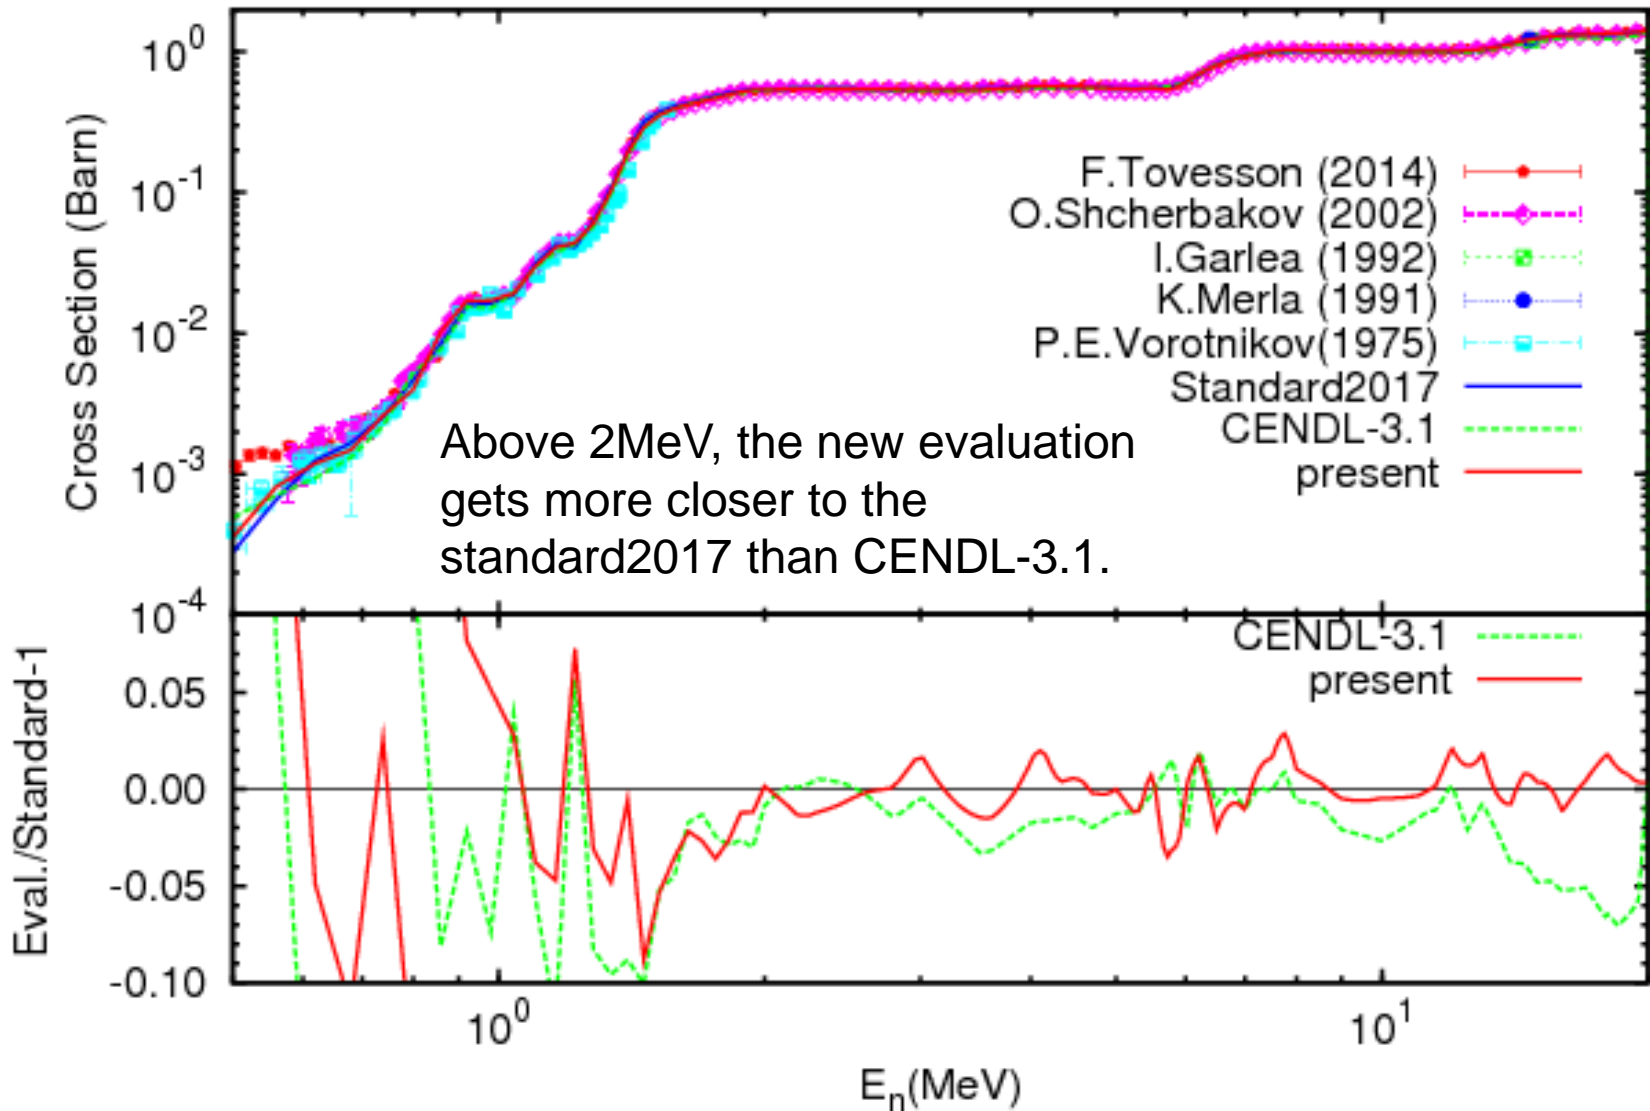

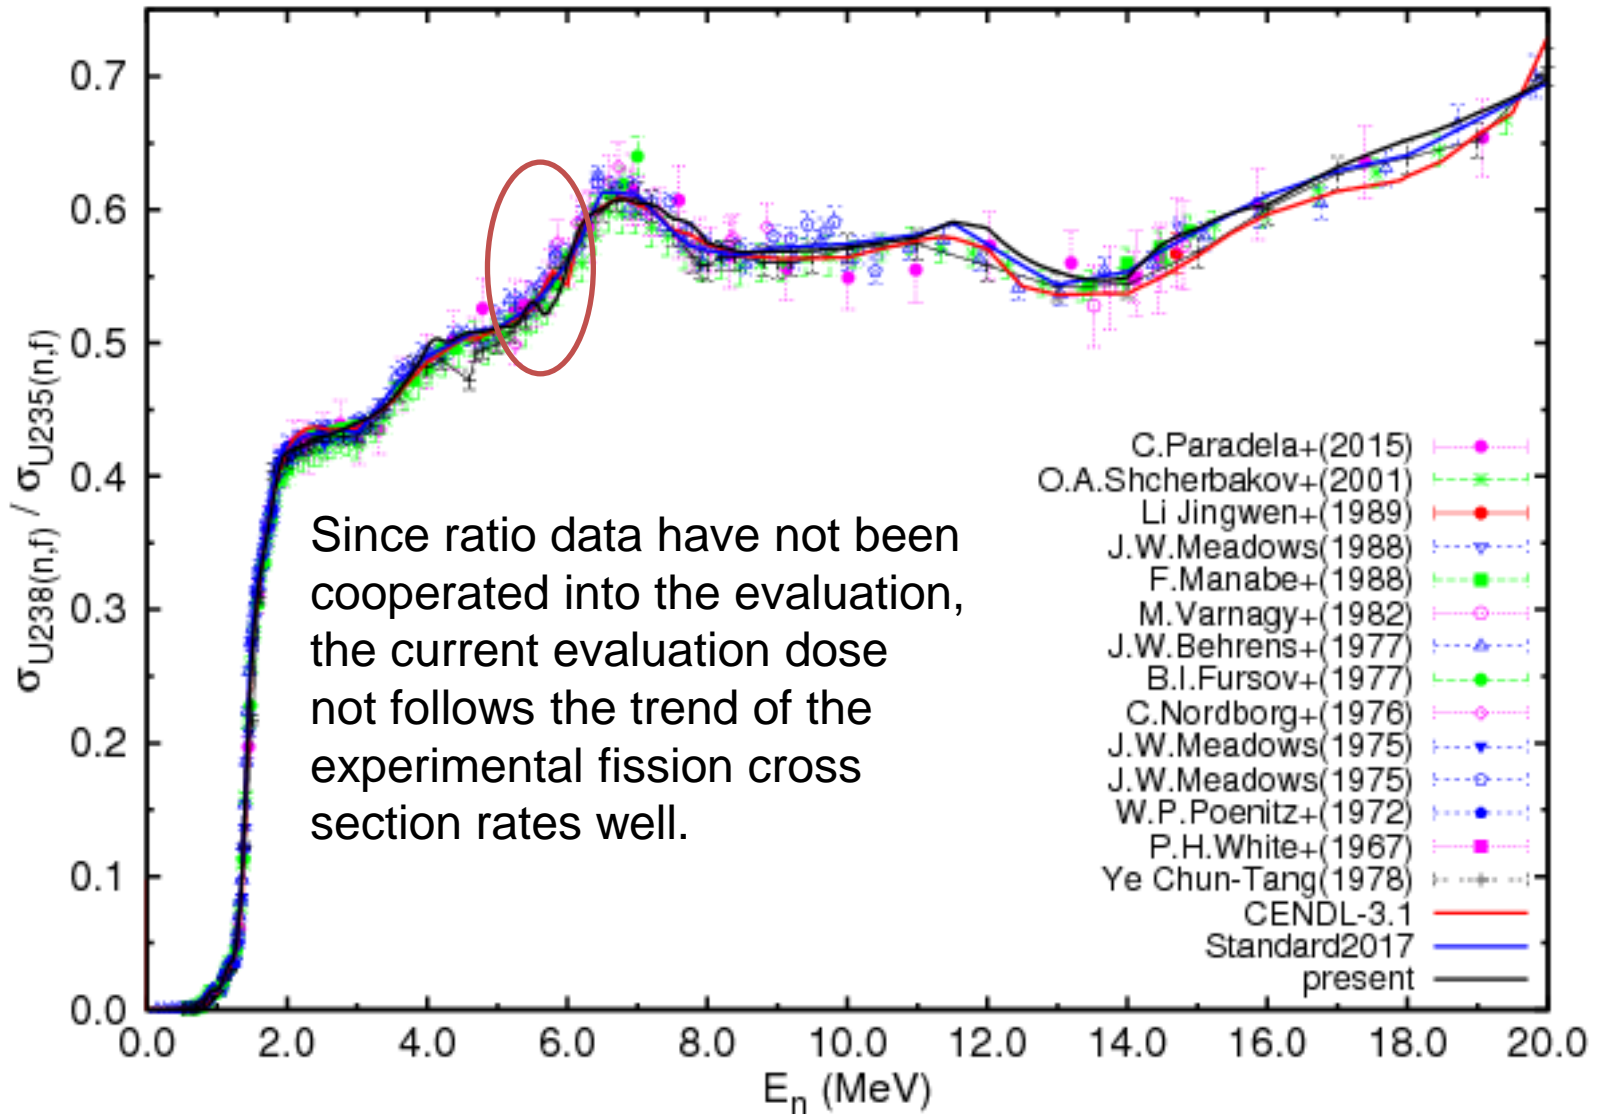

U-238(n,f) Cross Section

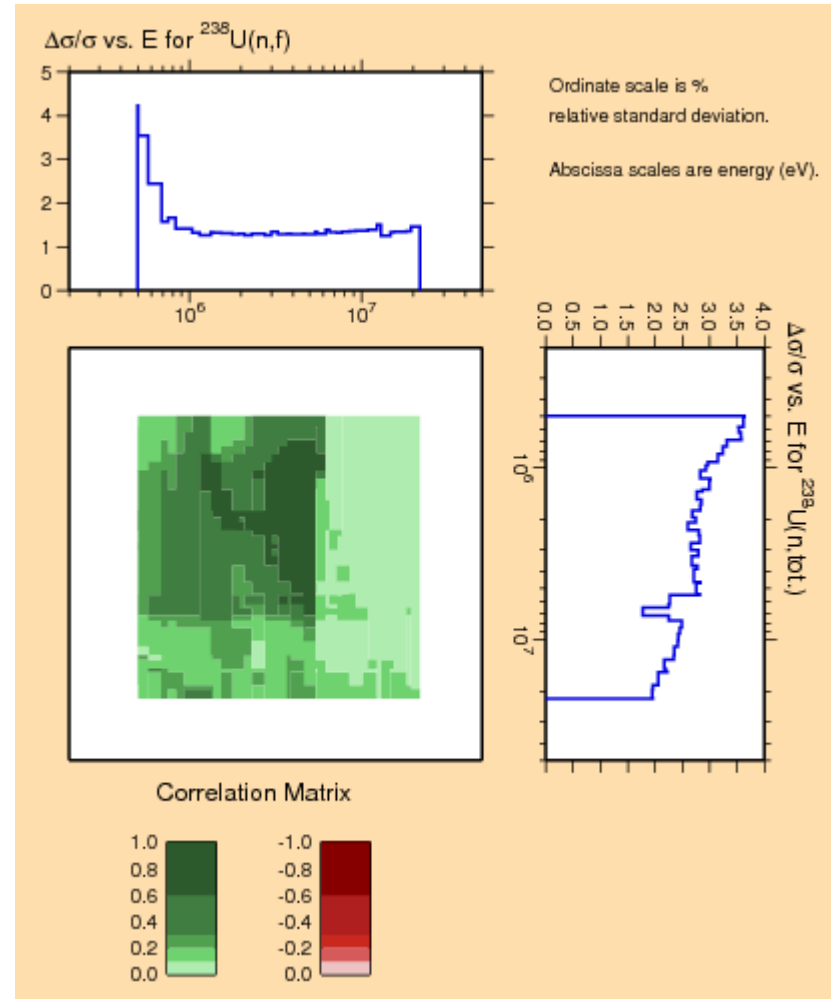

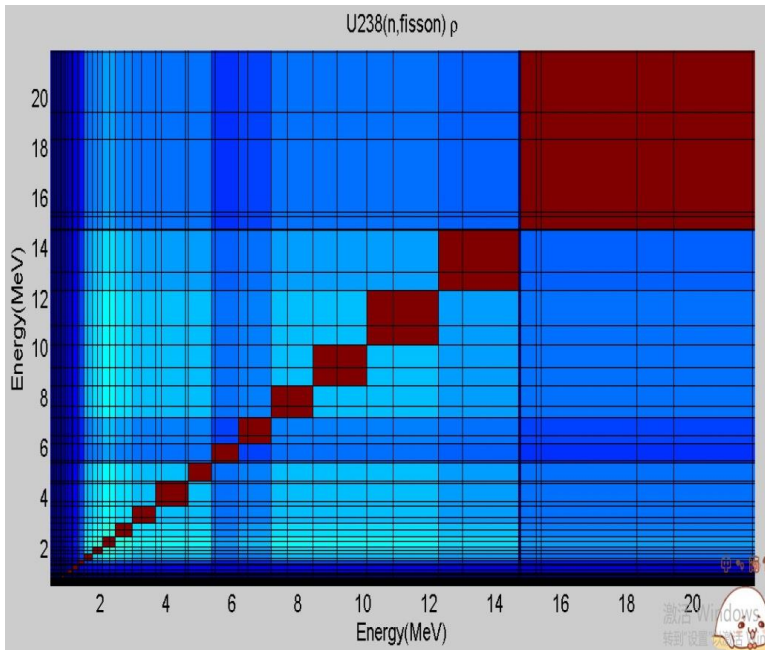

Ratio of $^{238}\text{U}(n,f)/^{235}\text{U}(n,f)$ below 20MeV

Comparison of evaluated covariance

- Covariance matrices for each data set were constructed based the uncertainty information given by the author.
- After processed by ASEU-2.0 code , positive matrix of correlation coefficients were obtained.

Discussion

- Does the current selection of experimental data is enough?
- Is it a proper way that do the LS fit without using covariance data from experiments?
- How to judge if the evaluation of covariance for each data set is reasonable?

Thank you for your attention !
